Substrate validation: four external quantitative predictions
1. Interior optimum of affinity
identity
measured a at equilibrium
predicted $a^* = \sqrt{R(N-1)/(2k_cN^2)}$
2. Breeder's equation
$h^2 = 1$
R/S
fraction selected by truncation
3. Neutral drift
estimated N_e
$N_e = 0.47\,N$
N_e estimated from $-\ln(V_T/V_0)/g$
census N
4. Mutation-drift balance
$V_{eq} = 2N_eV_m$, $2N_e = 344$
V_{eq} of the marker
mutational variance $V_m = \sigma^2$
